

Validation of User Login : Writeup

(Phase 2 - Lesson 1)

Name : K V Sagar

- Two Servlets are created to meet the requirements:
 1. *userLogin.java*
 2. *SuccessServlet.java*
- The *userLogin.java* is the one that handles the login page.
- The *SuccesServlet.java* shows the dashboard page, here a welcome message is printed.
- An if condition is used to check if the user ID and the password entered by the user matches.
- If the condition is satisfied i.e. the user ID and password match then the **RequestDispatcher** is used to forward the request to the *SuccessServlet.java* thus validating the user.
- If not, an error message is printed notifying the user that the credentials do not match and the user is still kept in the login page allowing them to try again.
- The html code is written to accept the user ID and the password from the user, along with the submit button.
